AB   - PURPOSE: To protect software by ciphering a decipher key of
       software with an individual key of a user to obtain assent
       information and enabling only a regular user to decipher the
       decipher key from assent information.
       CONSTITUTION: In a software managing part 1, an individual key of
       the regular user is generated by an individual key generating
       part 3 and is reported, and software of a normal text is ciphered
       with the decipher key by a software ciphering part 5 to obtain a
       ciphered text, and the decipher key is ciphered with the
       individual key by a key ciphering part 4 to obtain assent
       information. Ciphered text software and the decipher key ciphered
       as assent information are transferred to the user. Though
       software presented from the software managing part 1 is copied,
       deciphering and execution without the decipher key are impossible
       because it is ciphered, and thus, software is protected.
